Studio AccÜ Panel

Detail shot

One unique characteristic of wood is its ability to absorb and distribute sound waves. Acoustical panels are not new to the market place. In fact, there are a number of large producers of acoustical panels soliciting their products to architects and designers, many of whom purchase veneer from us.

Our position is not to re-invent the acoustical panel, but to offer our clients the full capability of customization through our own production capacity. The Studio AccÜ Panel is available in custom sizes, using custom veneers, custom patterns and even custom finishes if the client so chooses.

The Studio AccÜ Panel is available with FSC® certification and can also be produced using NAUF substrates should the project require it.
